#### 4.10 More Flow Models

- Maximum/Minimum flow with lower bound / Circulation problem
  - 1. Construct super source S and sink T.

  - 2. For each edge (x,y,l,u), connect  $x\to y$  with capacity u-l. 3. For each vertex v, denote by in(v) the difference between the sum of incoming lower bounds and the sum of outgoing lower bounds.
  - 4. If in(v)>0, connect  $S\to v$  with capacity in(v), otherwise, connect  $v\to T$  with capacity -in(v).
    - To maximize, connect t 
      ightarrow s with capacity  $\infty$  (skip this in circulation problem), and let f be the maximum flow from S to T. If  $f \neq \sum_{v \in V, in(v) > 0} in(v)$ , there's no solution. Otherwise, the maximum flow from s to t is the answer
    - To minimize, let f be the maximum flow from S to T. Connect  $t \to s$  with capacity  $\infty$  and let the flow from S to T be f'. If  $f+f' \neq \sum_{v \in V, in(v)>0} in(v)$ , there's no solution. Otherwise, f' is the answer.
  - 5. The solution of each edge e is  $l_e+f_e$  , where  $f_e$  corresponds to the flow of edge  $\boldsymbol{e}$  on the graph.
- ullet Construct minimum vertex cover from maximum matching M on bipar- ${\rm tite\ graph\ }(X,Y)$ 
  - 1. Redirect every edge:  $y \to x$  if  $(x,y) \in M$ ,  $x \to y$  otherwise.

  - 2. DFS from unmatched vertices in X. 3.  $x \in X$  is chosen iff x is unvisited. 4.  $y \in Y$  is chosen iff y is visited.
- Maximum density induced subgraph
  - 1. Binary search on answer, suppose we're checking answer  ${\cal T}$

  - 2. Construct a max flow model, let K be the sum of all weights 3. Connect source  $s \to v$ ,  $v \in G$  with capacity K 4. For each edge (u,v,w) in G, connect  $u \to v$  and  $v \to u$  with
  - capacity w 5. For  $v\in G$  , connect it with sink  $v\to t$  with capacity  $K+2T-(\sum_{e\in E(v)}w(e))-2w(v)$
  - 6. T is a valid answer if the maximum flow f < K |V|
- Minimum weight edge cover 1. For each  $v \in V$  create a copy v' , and connect  $u' \to v'$  with
  - weight w(u,v). 2. Connect  $v \to v'$  with weight  $2\mu(v)$ , where  $\mu(v)$  is the cost of the cheapest edge incident to v .
  - 3. Find the minimum weight perfect matching on G'.
- Project selection problem
  - 1. If  $p_v > 0$ , create edge (s,v) with capacity  $p_v$ ; otherwise,
  - create edge (v,t) with capacity  $-p_v$ . 2. Create edge (u,v) with capacity w with w being the cost of choosing u without choosing v.
  - 3. The mincut is equivalent to the maximum profit of a subset
- 0/1 quadratic programming

$$\sum_{x} c_{x} x + \sum_{y} c_{y} \bar{y} + \sum_{xy} c_{xy} x \bar{y} + \sum_{xyx'y'} c_{xyx'y'} (x\bar{y} + x'\bar{y'})$$

can be minimized by the mincut of the following graph:

- 1. Create edge (x,t) with capacity  $c_x$  and create edge (s,y) with
- capacity  $c_y$  . Create edge (x,y) with capacity  $c_{xy}$
- 3. Create edge (x,y) and edge (x',y') with capacity  $c_{xyx'y'}$ .

6.18 Generating Functions
  • Ordinary Generating Function A(x) = \sum_{i \geq 0} a_i x^i
```

```
\begin{array}{l} -A(rx)\Rightarrow r^na_n\\ -A(x)+B(x)\Rightarrow a_n+b_n\\ -A(x)B(x)\Rightarrow \sum_{i=0}^na_ib_{n-i}\\ -A(x)^k\Rightarrow \sum_{i+i+2+\dots+i_k=n}^na_{i_1}a_{i_2}\dots a_{i_k} \end{array}

\begin{array}{c}
A(x) \to \sum_{i_1+i_2} \\
xA(x)' \Rightarrow na_n \\
\frac{A(x)}{1-x} \Rightarrow \sum_{i=0}^n a_i
\end{array}
```

• Exponential Generating Function  $A(x) = \sum_{i \geq 0} \frac{a_i}{i!} x_i$ 

```
A(x) + B(x) \Rightarrow a_n + b_n
\begin{array}{lll} -A^{(k)}(x) & \stackrel{\rightarrow}{\Rightarrow} a_{n+k} & \\ -A(x)B(x) & \stackrel{\rightarrow}{\Rightarrow} \sum_{i=0}^{k} \binom{i}{i} a_i b_{n-i} & \\ -A(x)^k & \stackrel{\rightarrow}{\Rightarrow} \sum_{i_1+i_2+\dots+i_k=n} \binom{i}{i_1,i_2,\dots,i_k} a_{i_1} a_{i_2} \dots a_{i_k} \\ -xA(x) & \stackrel{\rightarrow}{\Rightarrow} n a_n & \end{array}
```

• Special Generating Function

$$\begin{array}{l} - & (1+x)^n = \sum_{i \geq 0} \binom{n}{i} x^i \\ - & \frac{1}{(1-x)^n} = \sum_{i \geq 0} \binom{n-1}{i} x^i \end{array}$$

### 6.19 Linear Programming Construction

Standard form: maximize  $c^Tx$  subject to  $Ax \le b$  and  $x \ge 0$ . Dual LP: minimize  $\mathbf{b}^T\mathbf{y}$  subject to  $A^T\mathbf{y} \geq \mathbf{c}$  and  $\mathbf{y} \geq \mathbf{0}$ .  $\bar{\mathbf{x}}$  and  $\bar{\mathbf{y}}$  are optimal if and only if for all  $i \in [1,n]$ , either  $\bar{x}_i = 0$ or  $\sum_{j=1}^m A_{ji} ar{y}_j = c_i$  holds and for all  $i \in [1,m]$  either  $ar{y}_i = 0$  or  $\sum_{j=1}^{n} A_{ij} \bar{x}_j = b_j$  holds.

```
1. In case of minimization, let c_i^\prime = -c_i
2. \sum_{1 \le i \le n} A_{ji} x_i \ge b_j \to \sum_{1 \le i \le n} A_{ji} x_i \le -b_j
3. \sum_{1 \leq i \leq n} A_{ji} x_i = b_j
                \sum_{\substack{1 \le i \le n \\ 1 \le i \le n}} A_{ji} x_i \le b_j
```

4. If  $x_i$  has no lower bound, replace  $x_i$  with  $x_i - x_i'$ 

#### 6.20 Estimation

- The number of divisors of n is at most around 100 for  $n\,<\,5e4$ , 500 for n<1e7, 2000 for n<1e10, 200000 for n<1e19. • The number of ways of writing n as a sum of positive integers
- disregarding the order of the summands.  $1,1,2,3,5,7,11,15,22,30\,$ for  $n=0\sim 9$ , 627 for n=20,  $\sim 2e5$  for n=50,  $\sim 2e8$  for n = 100.

Total number of partitions of n distinct elements: 1, 1, 2, 5, 15, 52, 203, 877, 4140, 21147, 115975, 678570, 4213597, $27644437, 190899322, \ldots$ 

#### 6.21 Theorem

Kirchhoff's Theorem

Denote L be a  $n \times n$  matrix as the Laplacian matrix of graph Gwhere  $L_{ii}=d(i)$  ,  $L_{ij}=-c$  where c is the number of edge (i,j) in

- The number of undirected spanning in G is  $|\mathsf{det}( ilde{L}_{11})|$  .
- The number of directed spanning tree rooted at r in G is  $|\det(\tilde{L}_{rr})|$ .
- Tutte's Matrix

Let D be a n imes n matrix, where  $d_{ij} = x_{ij}$  ( $x_{ij}$  is chosen uniformly at random) if i < j and  $(i,j) \in E$ , otherwise  $d_{ij} = -d_{ji}$ .  $\frac{rank(D)}{2}$ is the maximum matching on G.

- Cayley's Formula
  - Given a degree sequence  $d_1, d_2, \dots, d_n$  for each labeled vertices, there are

$$\frac{(n-2)!}{(d_1-1)!(d_2-1)!\cdots(d_n-1)!}$$

- Let  $T_{n,k}$  be the number of labeled forests on n vertices with k components, such that vertex  $1,2,\dots,k$  belong to different components. Then  $T_{n,k}=kn^{n-k-1}$  .
- Erdős-Gallai Theorem

A sequence of non-negative integers  $d_1 \geq d_2 \geq \ldots \geq d_n$  can be represented as the degree sequence of a finite simple graph on n vertices if and only if  $d_1+d_2+\ldots+d_n$  is even and

$$\sum_{i=1}^k d_i \leq k(k-1) + \sum_{i=k+1}^n \min(d_i,k)$$

holds for all  $1 \leq k \leq n$ .

• Burnside's Lemma

Let X be a set and G be a group that acts on X. For  $g \in G$ , denote by  $X^g$  the elements fixed by g:

$$X^g = \{ x \in X \mid gx \in X \}$$

Then

$$|X/G| = \frac{1}{|G|} \sum_{g \in G} |X^g|.$$

• Gale-Ryser theorem

A pair of sequences of nonnegative integers  $a_1 \geq \cdots \geq a_n$  and  $b_1,\dots,b_n$  is bigraphic if and only if  $\sum_{i=1}^n a_i = \sum_{i=1}^n b_i$  and  $\sum_{i=1}^k a_i \leq 1$ 

 $\sum_{i=1}^{n} \min(b_i, k)$  holds for every  $1 \leq k \leq n$ .

• Fulkerson-Chen-Anstee theorem

A sequence  $(a_1,b_1),\ldots,(a_n,b_n)$  of nonnegative integer pairs with  $a_1 \geq \cdots \geq a_n$  is digraphic if and only if  $\sum_{i=1}^n a_i = \sum_{i=1}^n b_i$  and  $\sum_{i=1}^k a_i \leq \sum_{i=1}^k \min(b_i,k-1) + \sum_{i=k+1}^n \min(b_i,k) \text{ holds for every } 1 \leq k \leq n.$ 

- Möbius inversion formula
  - $f(n) = \sum_{d|n} g(d) \Leftrightarrow g(n) = \sum_{d|n} \mu(d) f(\frac{n}{d})$   $f(n) = \sum_{n|d} g(d) \Leftrightarrow g(n) = \sum_{n|d} \mu(\frac{d}{n}) f(d)$
- Spherical cap
  - A portion of a sphere cut off by a plane. r: sphere radius, a: radius of the base of the cap, h: height of the cap,  $\theta$ :  $\arcsin(a/r)$ . Volume =  $\pi h^2(3r-h)/3 = \pi h(3a^2+h^2)/6 = \pi r^3(2+\cos\theta)(1-\cos\theta)^2/3$ . Area =  $2\pi rh = \pi(a^2+h^2) = 2\pi r^2(1-\cos\theta)$ .
- Chinese Remainder Theorem
  - $x \equiv a_i \pmod{m_i}$
  - $M = \prod m_i, M_i = M/m_i$
  - $t_i M_i \equiv 1 \pmod{m_i}$
  - $x = \sum a_i t_i M_i \pmod{M}$
